

# Pure aluminum energy storage box sales plan design

Is aluminum a good energy storage & carrier?

Aluminum is examined as energy storage and carrier. To provide the correct feasibility study the work includes the analysis of aluminum production process: from ore to metal. During this analysis the material and energy balances are considered. Total efficiency of aluminum-based energy storage is evaluated.

What is aluminum based energy storage?

Aluminum-based energy storage can participate as a buffer practically in any electricity generating technology. Today, aluminum electrolyzers are powered mainly by large conventional units such as coal-fired (about 40%), hydro (about 50%) and nuclear (about 5%) power plants ,,,.

What is the feasibility study of aluminum based energy storage?

To provide the correct feasibility study the work includes the analysis of aluminum production process: from ore to metal. During this analysis the material and energy balances are considered. Total efficiency of aluminum-based energy storage is evaluated. Aluminum based energy generation technologies are reviewed.

Can aluminum be considered a perspective energy carrier?

So, aluminum can be regarded as perspective energy carrier and has a good chance for large-scale integration in global energy storage. To provide the correct feasibility study this work will be started from aluminum production process analysis, which will examine the whole chain: from ore to metal.

What is the calorific value of aluminum based energy storage?

Calorific value of aluminum is about 31 MJ/kg. Only this energy can be usefully utilized within aluminum-fueled power plant. So, it shows the efficiency limit. If 112.8 MJ are deposited, the maximum cycle efficiency of aluminum-based energy storage is as follows:  $31 \text{ MJ} / 72.8 \text{ MJ} = 43 \%$ . This percentage represents the total-thermal efficiency.

When will aluminium be used for energy storage?

Although it is possible that first systems for seasonal energy storage with aluminium may run as early as 2022, a large scale application is more likely from the year 2030 onward.

To transform the characteristics of energy storage devices from traditionally heavy and rigid to light and flexible, researchers have carried out studies from two aspects: (1) ...
